

How to discuss results in research.

This poster is a part of «Research course for persons with intellectual disabilities» in Norway - No. 6

Lisa Malin Kleven Fløan, Co- Researcher, Tine Gladsø, Co-Researcher, Gunn Eva Myren, Associate Professor, Nord university, Tove Mentsen Ness, Associate Professor, Nord university and May Østby, Associate Professor, HiØ

What is discussion in research?

- Discussing means that we should summarize, compare and critique the data we have found:
- When we discuss, we ask questions to the data.
- Data can be a text, film, images or numbers.
- We also must see what we've found out in the context of what others have found out about the same thing.
- We also discuss the results in relation to the research questions
- We discuss whether the way we have collected data is the best way

Ill. Mari Østby Kjøl

How to discuss?

- When we discuss, we need to discuss as thoroughly as possible.
- We need to question what we've found in the data material.
- We must also discuss for and against and whether we agree or disagree.
- When discussing, we often say it like this: «... on the one hand and on the other." This is often because we find different explanations and have different views on what we are discussing

When discussing in research:

- We use other people's research or experiences from books, newspapers, articles and the internet
- We use our own experiences and opinions.
- If we use our own experiences from fellow researchers, we can provide a better understanding of what we have found and what it may mean.
- Remember: We have different opinions when discussing, and that is important!
